Netflix Dashboard Analysis

Problem Statement

Netflix has a vast collection of movies and TV shows, making it difficult to analyze content distribution, trends, and performance. It is challenging to identify which type of content is more popular, which countries contribute the most content, and how content has grown over the years.

The objective of this project is to analyze Netflix data and build an interactive dashboard that provides meaningful insights into content trends, genre distribution, and country-wise performance.

Solution / Features

This project provides a Power BI dashboard that helps in analyzing Netflix content in a simple and interactive way.

Key features include:

- Data cleaning and transformation using Power Query
- Handling missing values and formatting columns
- Extracting year from date for trend analysis
- Creating an interactive dashboard with slicers

The dashboard includes:

- KPI cards showing total titles, total movies, and total TV shows
- Pie chart showing distribution of Movies vs TV Shows
- Line chart representing year-wise content growth
- Bar chart showing top countries by content
- Genre analysis showing most popular categories
- Top 10 directors based on number of titles
- Slicers for filtering by country, genre, year, and type

Tech Stack

The following tools and technologies were used to successfully complete this project:

- **Power BI – for dashboard and visualization:**

Power BI is used to design and develop the interactive dashboard. It helps in creating charts like bar charts, pie charts, and line charts, along with KPI cards and slicers.

- **Power Query – for data transformation:**

Power Query is used to clean and prepare the dataset. Tasks such as handling missing values, splitting columns, and formatting data are performed here.

- **CSV Dataset – for input data:**

The project uses a Netflix dataset in CSV format containing information like title, type, country, genre, and release year.

- **DAX – not used (basic aggregation used):**

Basic aggregations like count are used without complex DAX functions.

Unique Points

This project includes several unique features:

- Interactive dashboard with slicers for dynamic filtering
- Clean and structured layout for better understanding
- Combination of multiple charts for better analysis
- Netflix-style dark theme design
- Analysis of content based on genre, country, and year

Future Improvements

- Add real-time Netflix data using APIs
- Include rating and user review analysis
- Add advanced analytics like forecasting
- Improve UI with buttons and drill-through features

Conclusion

This project demonstrates how Power BI can be used to analyze and visualize Netflix data effectively. The dashboard provides valuable insights into content distribution, trends, and performance, making it easier to understand large datasets in an interactive way.
